NEBRASKA WEEKLY WEATHER AND CROP REPORT

Release 5/10/60

Week Ending 5/9/60

WEATHER Temperatures averaged from about 2 degrees below normal in the south to 5 degrees below in the north. Fair, warm conditions prevailed at both extremes of the week. It was cold and rainy Wednesday and Thursday. Heavy showers and considerable hail were recorded in the central and northeast. Slow soaking rains were reported in the west. There was some snow and freezing temperatures in the northwest.

Temperatures for April averaged near normal in the extreme north to about 3 degrees above in the southeast corner of the State. There were no unusual high or low readings except early in the third decade, when unseasonably warm weather occurred over the eastern and central portions of the State. Precipitation likewise was not far from normal. The Panhandle and southwestern portions of the State were rather dry, and the central, north central, and northeastern portions of the State had a wet month. The rainfall was over twice the normal at a few stations along the eastern half of the South Dakota border. There was more than the usual amount of windy weather.

CROPS Wet weather again last week interrupted field work and halted corn planting which was just getting started. Approximately 2 percent of the corn acreage was planted by last Saturday which was just a few days behind normal progress. Usually around 10 percent of the corn acreage is planted by this time.

Generous rains boosted prospects for spring sown crops, alfalfa and pastures. Most counties report adequate surface moisture so warmer temperatures should bring rapid growth to crops and grasses. Late seeded oats and barley are just sprouting but early seedings have a fair to good stand, although behind usual development to this date. Dehydrators were starting operations in a few localities as the most advanced alfalfa fields were ready for cutting. Pasture grasses made the best progress of the season so far, gaining condition in most sections.

Some replanting of sugar beets was necessary in the west because of frost damage and disease.

Winter wheat made good strides in the western counties. Moisture was ideal for the crop. Late wheat in the eastern counties reaped some benefit from the rains also. However, thin fields continue to be plowed up and weeds pose a threat in fields that failed to tiller properly since the crop emerged from the dormant stage.

Land preparation is fairly well advanced although behind usual progress. Planting activity for row crops should be fairly active as soon as fields are dry enough to work.

LIVESTOCK Condition of livestock continued to improve. In instances, low hay and forage supplies have resulted in livestock moving onto new pasture grass a bit early.

Shipments of feeder cattle and calves into Nebraska during April were 71,000 head, down 31 percent from the 102,000 head received in April 1959. Sheep and lambs shipped into the State for feeding amounted to 40,000 head compared with 29,000 head a year earlier.
